About DOT - What Is DOT?

DOT is the native token of Polkadot, a Layer-0 metaprotocol launched in 2020 to enable interoperability between blockchains. Rather than hosting applications itself, Polkadot provides shared infrastructure that allows independent blockchains to connect and exchange data securely. DOT is internet native and permissionless, used for staking, governance, and bonding parachains to the network.

In the News for the Week:

Polkadot Rallies by 27% as Investors Anticipate Halving Event

The halving event, scheduled for March 14, is expected to cut the native token's supply by 50%.

21Shares Submitted the 9th Amendment for the Polkadot Network ETF Application

The update mainly responds to previous regulatory feedback and optimizing details, providing clearer signals for advancement.

[\[VALOUR COMMENTARY\]](#)

Polkadot's weekly outperformance reflects a convergence of narratives that rarely align so clearly: a hard supply catalyst, renewed institutional attention, and meaningful decoupling from Bitcoin. The upcoming March 14 issuance cut — Polkadot's first-ever halving equivalent — has given the market a simple, time-bound scarcity story, while 21Shares' submission of a 9th amendment to its Polkadot ETF application signals continued regulatory progress toward institutional market access for the asset.

From a flow perspective, this is the kind of setup where price tends to move ahead of broader capital allocation. The 2.1 billion hard supply cap and sustained developer activity provide a fundamental backdrop that extends well beyond a single near-term catalyst.

This commentary is for informational purposes only and does not constitute investment advice.

[\[POLKADOT COMMENTARY\]](#)

Polkadot's recent protocol upgrades work together as a system. Asynchronous Backing increases how much work the network can process. Elastic Scaling determines how that capacity is allocated, allowing a single parachain to use multiple cores at once and scale throughput as demand rises. This makes the network well suited for real-time workloads such as DeFi trading, games, social applications, and large-scale IoT systems. This isn't theoretical. In December 2024, Kusama, Polkadot's canary network, was stress-tested under realistic conditions and sustained over 143,000 transactions per second on a live chain. And it used only a fraction of its total capacity (roughly 23 out of 100 cores). It demonstrated that the Polkadot architecture can handle massive traffic with stability, while still leaving significant headroom.

About ICP - What Is ICP?

ICP is the native token used to power the Internet Computer ecosystem. The Internet Computer is a blockchain project that aims to create a decentralized and scalable internet infrastructure by allowing smart contracts to run directly on its network, eliminating the need for traditional server-based architectures. It seeks to enable a new paradigm of web development, where applications are hosted natively on the blockchain, providing greater security, efficiency, and accessibility.

In the News for the Week:

Pakistan Digital Authority and DFINITY Partner for Sovereign Cloud Infrastructure and AI Software Systems

The agreement establishes Pakistan Subnet of Internet Computer Platform (ICP), supports tamper-proof digital infrastructure, enables local AI-native software development, and pilots national messenger app.

DFINITY Proposes 70% ICP Inflation Reduction Through 'Mission 70' Economic Restructuring

The DFINITY Foundation has released a new token economics white paper titled "Mission 70," aiming to reduce ICP inflation by 70% by 2026.

DFINITY Launches Caffeine, an AI Platform that Builds Production Apps from Natural Language Prompts

The AI platform allows users to build and deploy web applications through natural language conversation alone, bypassing traditional coding entirely.

[\[VALOUR COMMENTARY\]](#)

Internet Computer's rebound this week reflects a market beginning to re-engage with a project that has accumulated significant fundamental developments largely unacknowledged by price. The sovereign cloud partnership with Pakistan signals ICP's differentiated positioning – while most L1 projects compete for DeFi TVL, ICP is targeting government-grade infrastructure and AI workloads, a considerably less crowded market.

The Mission 70 tokenomics proposal adds a supply-side dimension: a structural reduction in inflation from 9.72% to approximately 2.92% by end of 2026, combined with increased burn mechanisms, meaningfully changes the asset's supply dynamics. Third-place global ranking in development activity further underscores that builder momentum remains robust.

This commentary is for informational purposes only and does not constitute investment advice.

[\[DFINITY COMMENTARY\]](#)

“The Internet Computer is a network that's designed to produce a new kind of cloud environment which hosts a new kind of serverless software. And that's what it turns out is very much ideal for AI to build on. The future is really a self writing cloud where AI forms the role of a kind of wish machine where you just say 'look, I need this app' and it'll say to you 'okay, here it is on a URL'. In that self writing future, it's essential that the apps that the wish machine is giving people are immune to traditional forms of cyber attack.”

Dominic Williams, President & Chief Scientist of the DFINITY Foundation, contributor to the Internet Computer blockchain. [The Cognitive Revolution](#), January 25, 2026

[ABOUT]

About UNI - What Is UNI?

UNI is the governance token for Uniswap, an Automated Market Maker decentralized exchange on the Ethereum blockchain. The UNI token allows token holders to participate in the governance of the protocol. Key decisions such as usage of the treasury or future upgrades can be decided through a governance vote.

[NEWS]

In the News for the Week:

Uniswap Price Soars as DAO Votes to Activate Fee Switch for 8 Blockchains

Uniswap tokenholders have started voting on proposals that could give them access to millions of dollars in additional monthly revenue.

BlackRock Brings USD\$1.8B Treasury Token to Uniswap in Major DeFi Push

In a clear sign that Wall Street and crypto are drawing closer, BlackRock is taking a decisive step into decentralized finance.

Uniswap Labs and Securitize Partner to Unlock DeFi Liquidity for BlackRock's BUIDL

BlackRock's USD Institutional Digital Liquidity Fund (BUIDL) is now available to trade via UniswapX.

[VALOUR COMMENTARY]

Uniswap's move this week is grounded in a structural shift that has been building for some time. The active expansion of the fee switch – now extending to eight additional L2 networks – transforms UNI's economic profile, with protocol-generated fees being used to reduce circulating supply across chains including Arbitrum, Base, and Optimism.

The reported accumulation of UNI tokens by institutional players adds a further dimension, reflecting growing engagement with DeFi infrastructure at the governance token level. With fee switch expansion and multi-chain liquidity dominance developing simultaneously, the drivers behind this week's price movement appear fundamentally anchored.

This commentary is for informational purposes only and does not constitute investment advice.

[UNISWAP COMMENTARY]

"Our mission at (Uniswap) Labs is simple: make exchanging value cheaper, faster and more accessible. Enabling BUIDL on UniswapX with BlackRock and Securitize supercharges our mission by creating efficient markets, better liquidity, and faster settlement. I'm excited to see what we build together."

Hayden Adams, Founder of Uniswap
