About JUP - What Is JUP?

JUP is the token used on the Jupiter platform. Jupiter is a tool on the Solana blockchain that helps users get the best prices when swapping tokens by connecting to many decentralized exchanges (DEXs). The JUP token allows users to vote on decisions about how the platform is run and improved. By combining liquidity from different sources and offering user-friendly tools, Jupiter makes decentralized trading on Solana simpler and more efficient.

In the News for the Week:

ParaFi Invests \$35M in Solana DeFi Platform Jupiter

This is the first time Jupiter has accepted outside institutional capital, and will use the funds to "deepen institutional participation in onchain finance".

Jupiter Proposes Near Zero Token Emissions in DAO Vote

Jupiter DAO submitted the "Going Green" proposal to cut net JUP emissions to zero by pausing team unlocks and delaying the Jupyter.

[\[VALOUR COMMENTARY\]](#)

Jupiter's performance reflects a protocol where institutional validation and supply mechanics are converging in a relatively rare combination. The ParaFi investment — Jupiter's first outside capital in five years of bootstrapped operation — was a signal of conviction to the market.

The recent DAO approval of zero net emissions for 2026 removes a persistent supply overhang at precisely the moment institutional demand is entering. As Jupiter continues to expand its product suite across aggregation, perpetuums, and lending, the fundamental backdrop for JUP is increasingly anchored in operating breadth rather than narrative alone.

This commentary is for informational purposes only and does not constitute investment advice.

[\[JUPITER COMMENTARY\]](#)

"At the start of 2025, Jupiter was Solana's largest trading venue. By the end of 2025, Jupiter became the most comprehensive onchain financial platform in all of crypto. In 12 months, we shipped 10 new product lines... Across it all, Jupiter processed \$1T in total volume on just a single chain. But what defined 2025 wasn't only what we shipped. It was the choices we made along the way."

Jupiter, X, March 1, 2026

[ABOUT]

About NEAR - What Is NEAR?

NEAR is the native token of the NEAR Protocol. One of the NEAR Protocol's best use cases is in supporting decentralized applications, particularly in the DeFi and NFT sectors. Its high scalability, low transaction fees, interoperability, and user-friendly features make it an ideal platform for these applications, enabling a wide range of financial services and digital asset management with enhanced performance and accessibility.

[NEWS]

In the News for the Week:

NEAR Protocol Jumps as Confidential Intents Drive \$2.7B Volume

Following the activation of Confidential Intents on March 3, NEAR crypto now trades with \$687.4M in daily volume, while its market cap sits just under \$1.78B.

NEAR Launches Near.com Super App, Touting AI Capabilities and Confidential Transactions

The company is betting that the next big wave in crypto will come from its convergence with AI.

NEAR Co-Founder Says AI Will Be Blockchain's Main User

He ties this framing to what he describes as crypto's failure to produce a consumer moment on par with the adoption of generative AI tools.

[VALOUR COMMENTARY]

NEAR's move reflects concrete product delivery rather than forward-looking announcements. The activation of Confidential Intents and the launch of Near.com arrived simultaneously — two components of the same infrastructure stack, now live and accessible. Together, the two launches move NEAR's AI-native positioning from thesis to deployed infrastructure, a distinction the market appeared to recognise over the course of the week.

This commentary is for informational purposes only and does not constitute investment advice.

[NEAR COMMENTARY]

"If AI agents become the final UI [...] then the most important layer is not the UI itself. It is the monetary coordination layer beneath it—the infrastructure where agents can discover counterparties, negotiate outcomes, and settle value autonomously at global scale. That layer is NEAR."

NEAR Blog, March 6, 2026

[ABOUT]

About AKT - What Is AKT?

AKT is the native token of the Akash Network. Akash is a decentralized cloud computing platform that connects developers with unused computing resources, offering a cost-effective and scalable alternative to traditional cloud providers. The AKT token is used for payments, staking, and governance, allowing holders to influence decisions about the platform's operations and growth. By enabling flexible, permissionless access to cloud services, Akash Network supports innovation and decentralization in the digital economy.

[NEWS]

In the News for the Week:

Burn-Mint Equilibrium (BME) Proposal Goes Live for Governance Vote

The BME proposal went onchain for a vote on March 6, with an upgrade scheduled for March 23.

Akash Mainnet 16 Upgraded

Developers now have greater visibility into their deployments and a faster, smoother experience on Akash Console, especially for those running at scale.

[VALOUR COMMENTARY]

"Akash's flow leadership this week reflects a market tracking two concurrent developments with direct tokenomic consequences. The BME governance vote, if passed, would structurally reshape how AKT interacts with compute demand on the network, directly linking token supply dynamics to real usage.

The recent Mainnet 16 upgrade, adds provider transparency, security hardening, and a more efficient market module, signalling a development cadence consistent with a protocol building toward enterprise-grade infrastructure."

This commentary is for informational purposes only and does not constitute investment advice.

[AKASH COMMENTARY]

"The wait is over. The Burn-Mint Equilibrium (BME) proposal is going onchain for a vote today, with an upgrade scheduled for March 23rd at 14:00 UTC. BME restores direct utility to \$AKT, anchoring token value to real network usage, where every \$AKT used for deploying will be burnt."
